2 **ABSTRACT**

3 Method and apparatus for dynamic instrumentation of an executable application
4 program. The application program includes a plurality of functions, each function
5 having an entry point and an endpoint. When the application is executed, a shared
6 memory segment is created for an instrumentation program and the application
7 program. Upon initial invocation of the original functions in the application program,
8 corresponding substitute functions are created in the shared memory segment, the
9 substitute versions including instrumentation code. Thereafter, the substitute functions
10 are executed in lieu of the original functions in the application program.
